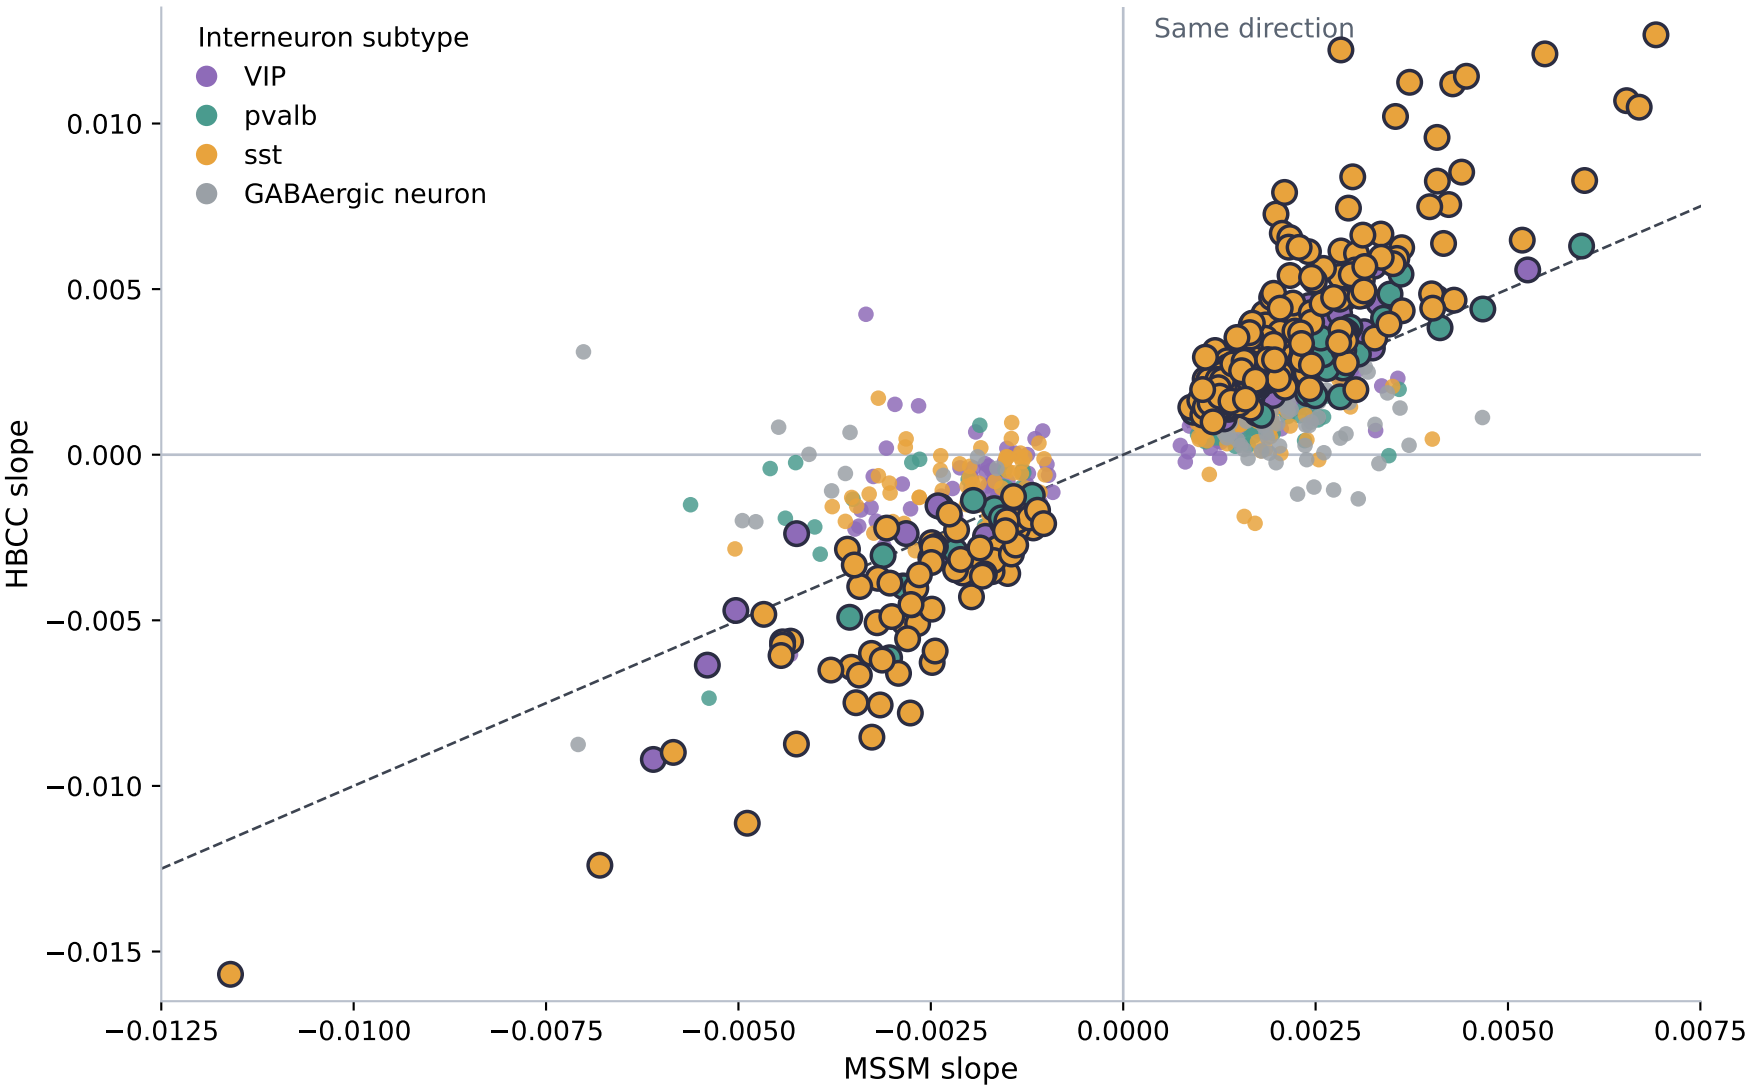
Interneuron genes move together in two cohorts

Age slopes, log counts per 10,000 per year. MSSM discovery vs HBCC replication. 768 genes shown.



At a glance

VIP 219 genes

pvalb 145 genes

sst 385 genes

730 of 768 genes shown move the same way in both cohorts.

Ringed points pass FDR in both cohorts.

Both-cohort FDR:
77 VIP, 65 pvalb, 239 sst.
Generic GABAergic neuron:
72 MSSM genes, 0 replicate.

Targeted gene change, not whole-profile drift: the same cells show no overall vector drift after depth adjustment.
MSSM 177 to 197 donors per subtype; HBCC 80 to 82 donors. Slopes from moderated precision-weighted models.
